NUMS

Cookie ordering, made simple.

Flutter cookie ordering app

Jethro Mark D. Bejec | CS301

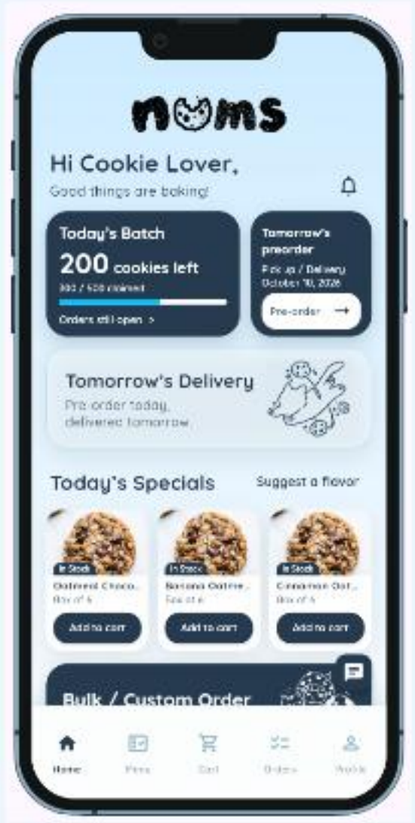

Problem and project goal

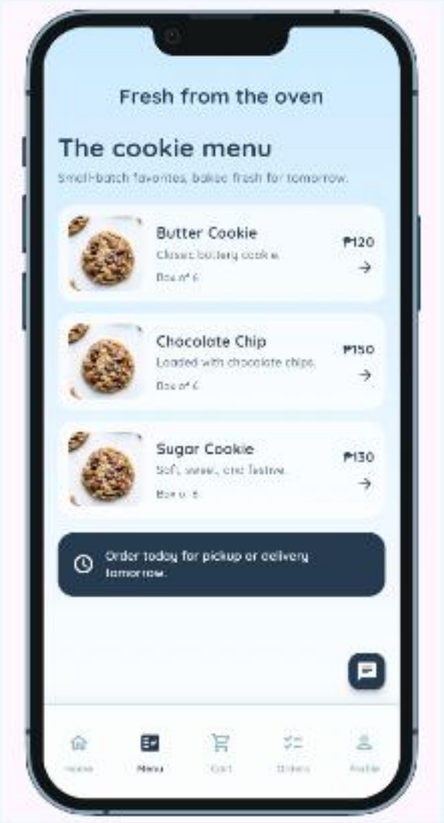

NUMS brings customer ordering and bakery coordination into one mobile flow.

Informal DMs and forms can make availability, custom preorders, payments, and fulfillment hard to follow.

BUILD-A-BOX

Live demo

Pause the slides here. Run the app demo, then return to slide 4.

01	**Customer sign-in**	Start at Welcome and sign in with the local customer demo account.
02	**Browse and customize**	Show Home and Menu, then add a flavor or build a custom box.
03	**Checkout**	Review the cart, show the payment warning, and complete simulated payment.
04	**Order progress**	Open confirmation and Orders to show the current status steps.
05	**Staff workflow**	Sign out, sign in as staff, and advance the paid order or a baking batch.

PAUSE HERE

Switch to the running app

Return to slide 4 when the demo is done.

Optional: show Chip's guided navigation if time allows.

Technology and scope update

The proposal set the direction; the submitted build stays within Flutter and Dart.

Flutter + Dart

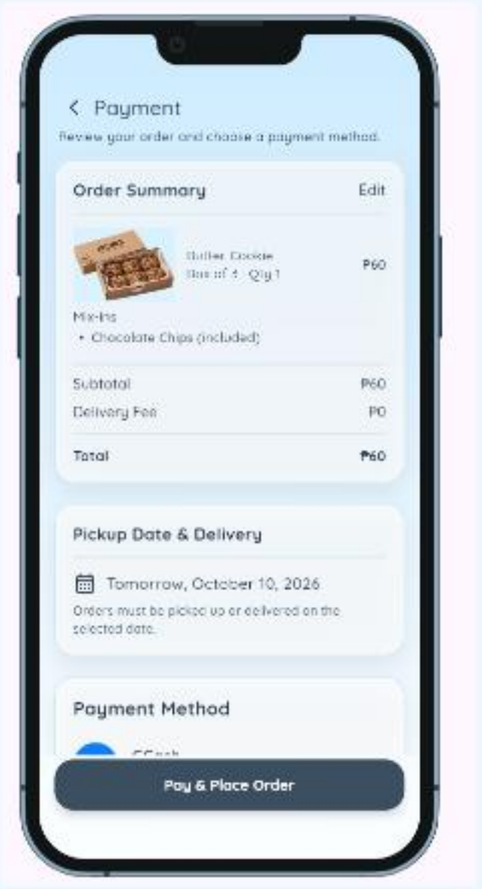

Provider shares local state across ordering, payment, notifications, and staff screens. DevicePreview keeps the mobile layout visible during development.

WHAT CHANGED FROM THE PROPOSAL

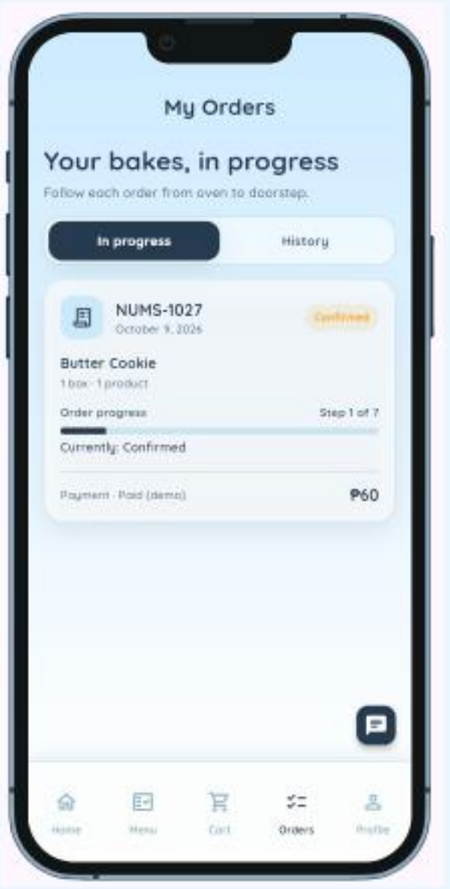

Firebase / Firestore and Firebase Auth were proposed, but this build uses in-memory demo data and local sign-in. Payment is simulated; GCash and Maya are not connected.

Daily capacity and staff tools run locally. Chip is a rule-based, screen-reader-friendly guide, not a cloud AI service.

PAYMENT

ORDERS

How I used AI

A clear account of the help I received and the choices I made.

80%

AI assistance

Help with Flutter functions, state flow, connecting screens, and debugging.

20%

My direction and design

I designed the layout and visual style, and wrote the welcome, login, and sign-up screens.

I also guided the motion, verification, and interaction details, and reviewed AI suggestions in the app.

My percentages are an honest estimate of assistance, not a measured code count.

Challenges and next steps

What took work, what I learned, and where I would improve the project.

01 **Challenge**

Keep ordering, payment, and staff screens connected and readable in a phone layout.

02 **What I learned**

Review the whole customer path and make each screen's state change clear.

03 **Next steps**

Check edge cases, accessibility actions, and mobile sizes. Consider persistent shared data only if the app needs it.

NUMS today

A local demo of the cookie ordering journey.
